DRAFT FOR REVIEW - NOT SUBMITTED

Conditional CloudBank ACCESS concept

Explore ACCESS

Conditional alternative draft — not submitted; proceed only if managed Classroom fits the approved CPU/GPU strategy.

Project and team

Title: UArizona INFO 521 and LIS 671 CPU Classroom Pilot — [APPROVED TERM / YEAR]

Institution: University of Arizona · College of Information Science

Pi: Greg Chism (proposed PI; confirm ACCESS profile, affiliation and eligibility before submission)

Co Pis: [APPROVED COURSE LEAD(S), IF CO-PIs]

Dates: [PROJECT START: SIX WEEKS BEFORE COURSE] through [PROJECT END: TWO WEEKS AFTER FINAL COURSE DATE]

Students: 80 planned students: 40 data science and 40 MLIS; confirm actual enrollments

Staff: Up to six instructional/technical staff accounts; confirm role mapping and whether these count against provider limits

Public overview

The University of Arizona College of Information Science requests CloudBank Classroom access through ACCESS for a two-course pilot in [TERM / YEAR]: INFO 521: Introduction to Machine Learning (proposed) and LIS 671: Digital Curation and Digital Preservation (proposed). Approximately 80 students would use browser-based CPU workspaces for reproducible data analysis, small-model evaluation, metadata normalization, collection queries and portable research outputs. The pilot aims to reduce software setup barriers and improve continuity of access across different student devices. We will evaluate workspace access, assignment reproducibility, export/recovery and staff effort using aggregate results. Both courses will retain an equivalent small-data CPU fallback, with institution-supported oversight, data handling and end-of-term exports.

CPU + GPU scope and other resources

Planning workload: 80 students × 8 active workspace-hours/week × 15 weeks = 9,600 student workspace-hours; 2 vCPU each implies 19,200 CPU core-hours of active demand. A 25% usage allowance gives 12,000 workspace-hours / 24,000 CPU core-hours before provider orchestration/idle billing and staff use. These are workload descriptions, not CloudBank SUs or ACCESS credit conversion. Request an initial 5 GB home per student plus 20 GB shared data per course: 80 × 5 + 2 × 20 = 440 GB before staff homes and provider overhead. Core tabular/catalog inputs are bounded below 250 MB each; the home/shared allowance covers notebooks, multiple assignment copies, outputs and approved small projects. Measure usage in the canary and grow only for justified semester needs with provider approval. The earlier 20 GB-home / 2 TB Jetstream2 assessment is a larger planning scenario, not a minimum CloudBank requirement. This conditional managed-CPU concept excludes GPU. The intended ACCESS allocation includes GPU separately; this concept is usable only if the CPU/GPU implementation and coverage are explicitly confirmed. Numeric CloudBank credit/resource amount remains to be supplied from the provider’s actual managed-Classroom accounting; do not enter the Jetstream2 VM model as CloudBank credits.

Other available resources

Campus UITS/AWS: Greg confirms access via requests, restricted in this plan to CPU component testing; exact limits/charges/dates need confirmation. Free Kaggle and Colab GPU resources: staff pre-pilot benchmarks only, subject to actual account eligibility, quotas and hardware availability. ACCESS provides the intended CPU and GPU classroom allocation. CloudBank is conditional through ACCESS. CyVerse/MESA, NRP and OSPool remain optional separate components; MESA funding is not automatically an instructional allocation or operations budget.

COMPLETION AND REVIEW

Before submission and piloting

Use ACCESS for the large CPU and GPU allocation and the classroom pilot. Use campus UITS/AWS only to test CPU components, and free GPU resources to benchmark workloads before piloting. Size the ACCESS request from measured demand; consider CloudBank through ACCESS only if its managed service can meet the confirmed requirements.

Required completion

• Final approved syllabus PDF for the data science course — missing.

• Final approved syllabus PDF for the MLIS course — missing.

• PI CV/résumé PDF and co-PI CVs if applicable — missing.

• Confirm INFO 521 and LIS 671 selection/offering, instructor consent, course sections, enrollment, class dates and project preparation/export dates — missing.

• Provider-confirmed resource configuration, accounting/request amount and one-versus-two-project structure — missing.

• Named operator/backup, course leads, data/support approvals and budget/workload commitments — pending.

Review and submission steps

1. Designated eligible PI checks/creates their own ACCESS profile with matching institutional affiliation/email. No account has been created by this draft.

2. In the allocations portal, choose Explore ACCESS, Classroom / Training and CloudBank Classroom; confirm the current form and any course-specific project separation.

3. Paste the reviewed title, public overview, keywords, summary and provider-confirmed configuration/amount; supply the actual course dates/enrollment.

4. Attach the final approved syllabus PDFs and required CV/résumé PDFs, using the current portal/provider guidance. This generated request PDF is supporting draft text, not a substitute for either syllabus.

5. The human PI reviews scope, eligibility, disclosures, attachments and contact details before submitting. This site has no submission action.

Supporting draft, not a final tier-specific resource document, syllabus, CV or completed portal submission. All benchmark/readiness checks remain planned.

ACCESS request preparation
